Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-4 are rejected under 35 U.S.C. 103(a) as being unpatentable over Moszner et al EP 0897443 in view of Hiwara et al US 6166100 and Musa US 6953862. Moszner et al et al teach oxetane substituted with isocyanate. See, for example, page 4 lines 28-30, page 7 and page 10 lines 10-20. While Moszner et al does not specifically teach a acryloyl substituent linked to isocyanate. However, Hiwara et al teach analogous oxetanes having this group for the purpose of obtaining good dispersibility and flow properties. See, for example, column 1 lines 34-44, column 2 lines 1+ particularly lines 45-50. To modify Moszner et al to obtain these properties in light of these teachings would have been obvious to one of ordinary skill in the art and therefore unpatentable.

Applicants' comments have been noted and considered but are not deemed persuasive of patentability. This is particularly true in further view of Musa which teaches analogous oxetane compounds having analogous uses containing

bifunctional groups corresponding to applicants' A in formula (1). See column 4 lines 1-10, 28-33, 52-53.

Claims 5 and 6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Mikito et al JP11246541, (1999), English abstract (best available).

The references are applied as in the previous office action. Mikito et al teach of reacting an oxetane with an isocyanate using a tertiary amine catalyst in a process analogous to that recited in the claims. See the abstract. To use somewhat different but otherwise analogous starting materials in an otherwise known process would have been obvious to one of ordinary skill in the art as the results, substituted oxetane carbamates, would not have been unexpected. One of ordinary skill would expect the same process steps using similar reactants to yield the same products absent evidence to the contrary.

No claim is allowed.
